

Leveraging JMAG-RT and FEA-based Models for High Fidelity Real-Time Test in FPGA

Ben Black
National Instruments

Abstract :

Real-time test in the area of power electronics provides unique challenges that are difficult to address with traditional hardware-in-the-loop (HIL) systems. The high speed discrete switching states of power electronics systems mean that the simulation system needs to run on the order of 1 us to provide useful numerical results, and the benefits during algorithm development are directly related to the fidelity of the model. A good test system allows a control engineer to speed up the design cycle by allowing control testing to start without physical hardware, to test novel control algorithms without endangering hardware and to see potentially un-measurable parameters within the system. To address these issues and to provide a platform for HIL testing of electric motor systems, National Instruments has partnered with JSOL Corporation and developed field programmable gate array (FPGA) models that use JMAG-RT as a means to deploy the high-fidelity of an FEA simulation into the high speed of a FPGA processing node.

Leveraging JMAG-RT and FEA-based Models for High Fidelity Real-Time Test in FPGA

Why is HIL important?

- Parallel controller development
- Decreased controller tuning time
- Protection of expensive prototype motors
- Ability to safely complete potentially destructive tests

ni.com

HIL Simulation for Power Electronics

Keys to success for power electronics simulations

- High fidelity models
 - Non-linear
 - Time varying
- Sub 1us timing
- High speed I/O (1-10x the loop rate)

Future Investments

- Further integration with JMAG-RT motor types
- Advanced, non-linear inverter models
 - Importing models from other environments
 - Lookup table-based inverter models
- Variable time step, energy-based inverter model

ni.com

Summary

- JMAG Add-on For VeriStand and LabVIEW
- Modeling Options
 - Micro-processor based model (20-30 usec)
 - FPGA-based d-q model with constant parameters (<1 usec)
 - FPGA-based d-q model with JMAG Addon (~1 usec)
 - FPGA-based Spatial Harmonic Model with JMAG (~1 usec)
- High-Fidelity motor emulation with SET
